ÍV Universal Keyboard Wedge Programming Guide
Introduction

Manual Overview

This manual contains programmable features and information for the Universal Keyboard Wedge interface ONLY.

NOTE

The Universal Keyboard Wedge interface offers a larger, more enhanced feature set than the standard Keyboard Wedge interface covered by the other programming manuals for your scanner. Make sure that you select the correct interface type (standard Keyboard Wedge or Universal Keyboard Wedge) that offers the options you require for your installation, and that you have the correct manual(s) that will allow you to program all the desired features.
INTRODUCTION

Manual Overview - continued

You will need to reference the programming guide that is specific to your scanner model in order to access and modify features other than those specific to the Universal Wedge interface. See the topic, Programming Manual References, later in this section for important information on other manuals you may need to use.

As previously stated, this manual contains programming and feature information for scanners equipped with PSC® Universal Keyboard Wedge interface capabilities. At the time of this writing, scanner models that offer this interface are:

QuickScan® VS800       HS1250
VS1000                  VS1200
SP400                   PowerScan®
QuickScan® QS1000       QuickScan® Duet®
QuickScan® QS6000/QS6000 Plus
Manual Overview - continued

Other scanners could also have the ability to use these features. Call your PSC dealer to verify if your scanner can take advantage of Universal Wedge features.

Manual Contents

These sections are included in this manual:

• **Introduction** - If you've never programmed a scanner before, you'll want to familiarize yourself with the basics included in this section.

• **Communication Modes** - This section includes information about physical connections and cabling, using Cloning Mode to duplicate programming configuration between scanners, and also how to use a PC to down/upload software to a scanner.
Manual Contents - continued

• **Editing Mode** - The Universal Keyboard Wedge interface also supports the scanner's ability to edit bar code label data before sending it to the host terminal. This feature allows the flexibility of character matching, defining fields, the addition of preambles/postambles, and more.

• **Wedge Programming** - This section contains programming specific to keyboard wedge features, such as return to factory defaults, selecting the specific keyboard type, "end of message" characters, numeric characters, time out between characters, and WYSE time out.

• **RS-232 Interface Configuration** - The RS-232 interface features provided in this section are an enhanced set that are only available for scanners equipped with the Universal Keyboard Wedge interface. These features include options for baud rate, parity, stop bits, "end of message" characters,
Manual Contents - continued

intercharacter delay, ACK/NAK protocol, Xon/Xoff protocol, double RS-232 mode, and RS-232 in/out mode.

• **Wand Emulation I/F Configuration** - Like the RS-232 interface, the Wand Emulation interface features contained in this manual are a special programming set offering different options than the standard PSC Wand Emulation feature set.

• **Symbologies** - This section allows you to select and customize settings from among several bar code symbologies that are in common use today.

• **Appendices** - The appendices to this manual contain general feature settings that are common to all interfaces, such as beeper, preamble/postamble, locking access to programming, displaying the firmware level, etc. The appendices also provide handy numeric keypads, character tables, as well as the full ASCII table.
INTRODUCTION

How to Use this Manual
Each programmable feature listed in this manual is presented with a brief description of how the feature works, its selectable options, and the programming bar codes needed to select and set it.

IMPORTANT
Universal Keyboard Wedge interface programming requires the scanner to read Code 39 (C39) symbology bar codes. If your scanner was previously configured with C39 disabled, you will need to re-enable it before proceeding. See Appendix F, Enabling Code 39.

NOTE
In order to produce this manual at a reasonable size, many pages contain two bar codes. You will need to completely cover any bar codes you do not intend to scan (with your hand or a piece of paper) to prevent accidental mis-programming.
INTRODUCTION

Features Supported
Additionally, since not all features are available for all scanners, you'll need to reference each description to determine if your scanner model supports that particular feature. The following icons are used to indicate when your scanner supports a feature. A diagonal line through the icon signifies that the feature is not available for that model.

VS800™  VS1000™
VS1200™  VS1250™
QuickScan™ 1000  QuickScan™ 6000
PowerScan™  Duet™
SP400™ Worldwide Wedge  ALL
SP400™ RF
EXAMPLE: PowerScan™ NOT supported
How to Program Your Scanner

To program your scanner using this manual, follow these guidelines:

1. Entering Programming Mode is done by scanning the START bar code located on the inside back cover of this manual.

   **NOTE**
   
   The scanner indicates when it is in Programming Mode by continuously flashing its green LED indicator lamp.

   The scanner must be in Programming Mode in order to modify any programmable features.
How to Program Your Scanner - continued

2. Select the desired interface. This manual offers only two selections for this:
   a) The Universal Keyboard Wedge interface (see the *Universal Keyboard Wedge Interface Configuration* section).
   b) The RS-232 interface (see the *RS-232 Interface Configuration* section).

3. Scan the bar codes from the appropriate section (*Universal Keyboard Wedge Interface Configuration* or *RS-232 Interface Configuration*) to select options and modify features for the selected interface type.

   **NOTE**

   If the scanner's beeper is enabled, it will emit a "good read" beep as each bar code is read successfully.

4. After all desired programming parameters have been set, you must end the session by scanning the END bar code located on the inside back cover of this manual.
INTRODUCTION

How to Program Your Scanner - continued

NOTE

Upon scanning the END bar code, the scanner's green LED will then cease its continuous flashing, indicating it is no longer in Programming Mode. The scanner is now ready for normal operation.

5. If you will require the scanner to perform label editing, turn to the Editing Mode section and carefully follow the instructions to program this function.
INTRODUCTION

If You Make a Mistake...
If, during a programming session, you find that you are unsure of the scanner's Universal Keyboard Wedge settings or wish to re-set this configuration, use the Return to Factory Settings bar code on the next page to return all Universal Wedge parameters to their factory settings. Scanning this bar code will also reset any Universal Wedge changes made during previous programming sessions.

NOTE

When your scanner is first connected to a keyboard wedge host, the factory default setting (unless your scanner was custom configured) is communication with a U.S. PC/AT keyboard.

CAUTION

Use the FACTORY DEFAULTS bar code with caution, since it will disable/reset ALL Universal Wedge features that may have been programmed since the scanner's installation.
INTRODUCTION

Return to Factory Settings

Use the bar code below to return the scanner to the default settings configured at the factory for your scanner's original Universal Keyboard Wedge specifications. Other scanner programming (such as symbology selection and beeper settings) will not be affected.

This bar code is typically used to return the scanner to a "known good" operating state when the present programming status is not known, faulty, or suspect.

To reset Universal Wedge factory defaults, scan the bar code below.
Programming Manual References

In order to properly configure all scanner programming features for your particular application, you may need to use other additional programming manuals available from PSC®. Here are manuals that are currently available:

- R44-1020   SP400™ Programming Guide
- R44-2039   Keyboard Wedge Connectivity Guide
- R44-1140   SP*ACE™ and VS1000™ Prog. Guide
- R44-1340   VS1200™ / HS1250™ Programming Guide
- R44-1540   QuickScan™ 6000/6000 Plus Programming Guide
- R44-1740   Duet™ Programming Guide
- R44-1840   PowerScan™ Programming Guide
- R44-2018   QuickScan™ 1000 Programming Guide

Call your PSC dealer to inquire about other programming manuals that are available, or you can find copies of programming manuals and more information on the internet at [www.pscnet.com](http://www.pscnet.com).
Communication Modes

The Universal Keyboard Wedge interface offers several alternate modes to allow flexibility in communication between the scanner, its host, and even with other scanners.

These modes are:

- **Keyboard Wedge Mode** -- is the standard operational/communication mode.
- **Cloning Mode** -- allows duplication of configuration between a source scanner and a target scanner.
- **PC Down/Upload Mode** -- permits downloading of parameter values from a PC to a scanner. Additionally, it enables a scanner's configuration information to be displayed and saved on a PC. Finally, it allows testing of the scanner's RS-232 transmissions to the PC.
- **Editing Mode** -- provides a sophisticated capability to edit input data before its transmission to the host terminal. See the following section for more information.
Keyboard Wedge Mode

In this mode, the scanner is connected between the keyboard and the computer/host terminal (thus the term "wedge"). Scanned bar code data is processed by the scanner and emulated by the system as if it had been typed on the keyboard.

Communication 'Y' Cable

A special 'Y' cable is used to connect the scanner between the keyboard and the computer/host terminal. If you need a cable, contact your dealer for information about cables and their availability.

'Y' Cable Installation

1. Turn off power to your computer or host terminal.

2. Unplug the keyboard cable from the computer/host terminal, and plug it into the female connector of the 'Y' cable. (See Figure 1.)
3. Plug the male keyboard connection end of the 'Y' cable into the keyboard input port of the computer/host terminal.

4. Plug the remaining end of the cable into the scanner.

5. Power on the computer/host terminal.

6. Power on the scanner. A power-up beep or a sequence of beeps (depending upon the scanner type) will be emitted.
Cloning Mode

When a quantity of scanners must all be programmed with identical parameter settings, Cloning Mode permits quick and easy duplication of those settings from a pre-programmed source scanner to a target scanner.

To use Cloning Mode, follow these instructions:

1. Program a source scanner with all the settings necessary to allow full functionality with your system. Test this source scanner carefully to ensure that all parameters are correctly set.

2. Connect the source scanner to a target scanner using an approved cloning cable for your scanner type. If you need more information or need to obtain cables, contact your dealer.

3. Connect the source scanner and the target scanner to power.

4. Power-on both scanners.
Cloning Mode - continued

5. Scan this bar code with the source scanner:

\[ \text{ALL} \]

\[ \text{TRANSMIT CONFIGURATION} \]

6. Scan this bar code with the target scanner:

\[ \text{ALL} \]

\[ \text{RECEIVE CONFIGURATION} \]
Cloning Mode - continued

7. Power-off the target scanner, and connect the next target scanner. Repeat steps 2 through 6.

NOTE

When cloning multiple scanners, it is not necessary to read the TRANSMIT CONFIGURATION bar code (step 5) each time a different target scanner is connected. Simply scan the RECEIVE CONFIGURATION bar code in step 6 as each target scanner is connected for cloning.

To exit Cloning Mode, power the source scanner off, then on.
PC Down/UpLoad Mode

NOTE

This feature applies to VS/HS and SP400WW scanners ONLY.

This software is available from your dealer on a 3.5” disk (DOS compatible). It permits the functions listed below once the software is properly installed on the hard disk of a PC containing a COM 1 or COM 2 RS-232 port.

PC Down/UpLoad Mode functions are:

- **Download** – Download and set all parameter values.

- **Upload** – Display all parameter values contained in a scanner.

- **Test** – Test the RS-232 transmissions from a scanner to a PC. (This feature will not function unless the Universal Wedge RS-232 interface is enabled.)

- **Save** – Save (on a PC) a complete configuration of a scanner's parameter values.
PC Down/UpLoad Mode - continued

PC Down/UpLoad Mode can also be a very useful tool to quickly program a quantity of scanners with the same configuration. This process takes only a few seconds per scanner.

To install and use Down/UpLoad Mode:

1. Connect an approved AC adapter to the scanner.
2. Connect the scanner to COM 1 or COM 2 of your PC using PSC cable, P/N: 6015-0486.
3. Power-on on your PC and the scanner.
4. Copy the Down/UpLoad software from the floppy disk to your PC hard disk.
5. Use the mouse or keyboard to select the function desired and follow the instructions appearing on the screen.
PC Down/UpLoad Mode - continued

6. Read the following bar code to start the transfer between the PC and the scanner.

```
ALL
```

DOWN/UPLOAD DIALOG RELEASE

NOTE

When the transfer is completed, the scanner will return to its normal operational mode.
Universal KBW Interface Configuration

Universal Keyboard Wedge Interface Configuration

This section provides instructions and bar codes for programming Universal Keyboard Wedge parameters.

Programmable options included in this section are:

- Terminal/Keyboard Interface Selection
- End of Message Characters
- Upper/Lower Case Options
- Types of Numeric Characters
- Intercharacter Delay
- WYSE Timeout
Programming
Universal Keyboard Wedge Options

For assistance with scanner programming, follow the instructions given in Section 1 under the topic, *How to Program Your Scanner*.

If you make a mistake while programming the scanner, reference the topics, "*If You Make a Mistake...*", and "*Return to Factory Settings*" in the introductory section of this manual.

**CAUTION**

Use the FACTORY DEFAULTS bar code with caution, since it will disable/reset ALL Universal Wedge features that may have been programmed since the scanner's installation.
Activating the Universal Keyboard Wedge Interface

To activate the Universal Keyboard Wedge Interface, follow these instructions:

1. Scan the START bar code located on the inside back cover of this manual.

2. Determine the I.D. of the terminal/keyboard. This information is available in the Universal Keyboard Wedge Connectivity Guide (R44-2039), or refer to the second page following this one for a listing of the most common keyboard I.D.s.

3. Scan the ACTIVATE UNIVERSAL KEYBOARD WEDGE INTERFACE bar code on the following page.
Activating the Universal KBW I/F - cont.

4. Using the "number pad" on the following pages, scan in the digits for the keyboard I.D. number you determined in step 2.

5. Scan the END bar code on the inside back cover of this manual.
Terminal/Keyboard Settings

The list below contains the most common terminal/keyboard types. If your specific system is not listed below, consult the Keyboard Wedge Connectivity Guide (P/N R44-2039) for a detailed listing of terminal/keyboard types. A copy of the guide can be obtained from the internet at www.pscnet.com, or call your dealer for customer support information.

**NOTE**

The factory default communication mode setting is I.D. type 11, (PC AT, PS2).

<table>
<thead>
<tr>
<th>Terminal</th>
<th>I.D.</th>
</tr>
</thead>

END OF MESSAGE CHARACTERS
= NO CHARACTER
Upper/Lower Case Options
Scan one of the two selections below to select whether characters are sent as upper or lower case.

NOTE
The factory default setting for this option is UPPER CASE/CAPS.

LOWER CASE/SMALL – ENABLE
Types of Numeric Characters
This function allows the scanner to emulate either the numeric characters located on top of the keyboard or those located on the numeric pad. Use this function if trouble occurs with upper/lower case keyboard modes.

NOTE
This setting is enabled by default.
Types of Numeric Characters - continued

This function allows the scanner to emulate the numeric characters located on the numeric pad.

NOTE

If the option “NUMERIC PAD” is chosen, the numeric pad of the keyboard must be also turned on (locked) for correct operation (engage "Num Lock").
Universal KBW Interface Configuration

**Intercharacter Delay**

Scan the bar code from this and the following pages to select the desired pause (if any) between each character before it is sent to the host. This time delay is used to control the flow of data from the scanner, but it should not be required for most applications.

- **INTERCHARACTER DELAY = 0 ms**

- **INTERCHARACTER DELAY = 5 ms**
Intercharacter Delay - continued

INTERCHARACTER DELAY = 10 ms

INTERCHARACTER DELAY = 20 ms
Universal KBW Interface Configuration

Intercharacter Delay - continued

ALL

INTERCHARACTER DELAY = 50 ms

ALL

INTERCHARACTER DELAY = 100 ms
WYSE Timeout

To enable the WYSE timeout, follow these instructions:

1. Scan this ACCESS WYSE TIMEOUT bar code.

2. Scan the digit bar codes from the Numeric Pad in Appendix B to enter the desired timeout value.

IMPORTANT

To use the Numeric Pad, your scanner must be programmed to read single-digit Code 39 bar codes. Follow the instructions at the beginning of Appendix B to program this function.
3. Scan this VALIDATION bar code.
Editing Mode

Editing Mode has been designed to offer you complete flexibility to change the format of the data input message before transmission to the host system. Data will be edited when the input data meets certain criteria defined by the user (MATCH CONDITION).

Description of Features:

- **UP TO FOUR DATA OUTPUT FORMATS** can be programmed by the user and activated by different match conditions.

- **MATCH CONDITIONS**: up to four criteria can be accumulated:
  — fixed number of characters found.
  — pre-defined characters found (up to 3).
• EIGHT EDITING FUNCTIONS can be used to fix the output data format:
  - Divide the message into separate fields (up to five).
  - Add one or two postamble characters to each field.
  - Create additional fixed fields (up to two fields with six characters maximum).
  - Set the number of fields to be transmitted.
  - Cancel fields.
  - Set the position of the fields in the message transmitted.
  - Activate or deactivate selected formats.
  - Transmit data (or not) upon no-match.
Use of the Numeric Pad

Scanning of number digits is often required while in Programming Mode (to enter variable data). You’ll find a handy Numeric Pad in Appendix B.

**IMPORTANT**

To use the Numeric Pad, your scanner must be programmed to read single-digit Code 39 bar codes. Follow the instructions at the beginning of Appendix B to program this function.
Programming Sequence

1. Read the START bar code located on the inside back cover of this manual to enter Programming Mode.

2. Phase A -- START OF CONSTRUCTION. Select a format number #N (FORMAT #1-4) to construct by scanning its associated bar code.

3. Phase B -- Set up the MATCH CONDITION. Before editing data, scan the appropriate bar codes to define each of these four criteria for the input data:
   - Match with symbology (not available for all scanner models)
   - Match with number of characters
   - Match with input port
   - Match with pre-defined characters
Phase A
START OF CONSTRUCTION
(Select for Format #N)

Phase B
Set MATCH CONDITIONS
for Format #N

Phase C
Define the OUTPUT FORMAT
for Format #N

Phase D
END OF CONSTRUCTION
for Format #N

Do you wish to construct another Format?

Phase E
ACTIVATE OR DEACTIVATE FORMATS #1-4
Programming Sequence - continued

4. Phase C -- Define the OUTPUT FORMAT. Scan the bar codes to select options for each of the following parameters:
   - Divide the input message into fields (1-5)
   - Define the fields
   - Add (or not) 1 or 2 fixed fields
   - Set the number of fields to be transmitted
   - Cancel (or not) fields
   - Adjust the position of each field in the output message.

5. Phase D -- Scan the END OF CONSTRUCTION bar code corresponding to the format number #N (Format #1-4 selected in Phase A). If you would like to define a second format, start again at Phase A and select a second format number to program. Up to four formats can be defined.
EDITING MODE

Programming Sequence - continued

6. Phase E -- ACTIVATE EDITING MODE. **Important:** Editing mode is not activated by default. You must activate or deactivate Editing Mode for each of the format numbers desired. This allows you to retain format definitions while not actively using them.

7. Read the END bar code located on the inside back cover to exit Programming Mode and save the new parameters.
Programming Example

input data received: 123ABC456 (Code 39 label)
output data desired: CODE: C456 <TAB> REF: 123 <CR>

READ THE BAR CODE “START”

PHASE A: Read the bar code “START OF CONSTRUCTION FORMAT # 1”

PHASE B: Define the MATCH CONDITION using these three criteria

— 9 data characters
— received on all ports
— pre-defined char.: ABC in position 4

PHASE C: Next, prepare this phase on paper as follows:

<table>
<thead>
<tr>
<th>1 2 3</th>
<th>A B</th>
<th>C 4 5 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>field # 1</td>
<td>field # 2</td>
<td>field # 3</td>
</tr>
</tbody>
</table>

Then program Phase C

— Divide the message into 3 fields

| define field # 1 with 3 char. and CR as postamble | define field # 2 with 2 char. and no postamble | define field # 3 with 4 char. and TAB as postamble |
EDITING MODE

Programing Example (continued)

PHASE C: continued

— Construct the two additional fixed fields:
  fix field # 1: CODE:
  fix field # 2: REF:

— Set the number of fields to be transmitted: 4

— Adjust the positions of the fields and cancel field # 2 by acting as follows:

  1  ACCESS  2  ADD. FIELD # 1  3  FIELD # 3
  4  ADD. FIELD # 2  5  FIELD # 1  6  VALIDATION

Note: The positions of the fields in the output message are fixed by the reading sequence. Fields are cancelled when not read in the sequence.

PHASE D: Read the code “END OF CONSTRUCTION - FORMAT # 1”

PHASE E: Activate Editing mode on format # 1

READ THE BAR CODE “END”
PHASE A

START OF CONSTRUCTION OF NUMBER SELECTED

Up to 4 different output data formats can be constructed:

- Select a number and use the labels in Phases A - D to adjust its parameters, then come back to this phase to adjust another format if required.

FORMAT # 1: START OF CONSTRUCTION

FORMAT # 2: START OF CONSTRUCTION
EDITING MODE

PHASE A - continued

ALL

FORMAT # 3: START OF CONSTRUCTION

ALL

FORMAT # 4: START OF CONSTRUCTION

RS-232 DATA RECEIVED ON J1 or C2
PHASE B4

MATCH WITH PRE-DEFINED CHARACTERS

If no match is required for pre-defined characters, scan the bar code below.

NO MATCH REQUIRED FOR PRE-DEFINED CHARACTERS

Up to three characters can be defined. They can be located anywhere in the input message, but must be side by side.

Action 1: Read only one of the following three codes.

PHASE C0
DIVIDE THE INPUT
MESSAGE INTO FIELDS

Before starting this phase, it is advisable to prepare it on paper.

• Write down the input message and separate it into fields.

• Mark each field with a number from 1 to 5 maximum starting at the left hand side of the message.

• Enter the number of fields resulting from the division of the input message including the fields which do not require transmission.

• Define each necessary field using the Phase C1 selections.

Match Not Performed

Two possibilities are offered when a match is not performed on the input data:

• Data is transmitted to the host system in its original format.

STRAIGHT-THRU TRANSMISSION OF THE INPUT DATA

• Data is cleared and not transmitted.

NO TRANSMISSION OF THE INPUT DATA
The following pages provide instructions to configure RS-232 interface communications options for scanners equipped with the Universal Keyboard Wedge Interface.

NOTE

The RS-232 interface features provided in this section are an enhanced set that are only available for scanners equipped with the Universal Keyboard Wedge interface.
RS-232 Interface Configuration

The programming bar codes in this section pertain only to POS terminals with an RS-232 communication interface. In order for the POS terminal and scanner to communicate, the scanner's configuration must match the communication settings of the POS terminal.
RS-232 Interface Configuration - cont.
RS-232 Interface communication options are:

- Baud Rate
- Parity
- Data Bits
- Stop Bits
- End of Message Characters
- Timeout Between Characters
- ACK/NAK Protocol
- Xon/Xoff Protocol
- RTS/CTS Protocol
- Double RS-232 Mode
- In/Out Mode
- Intercharacter Delay
- Full ASCII Emulation
RS-232 Restrictions

NOTE

The RS-232 interface must first be selected (reference the following page) before you can set the RS-232 options in this section.

**Xon/Xoff** – Software flow control.
Xon (11 hex); Host ready to receive data.
Xoff (13 hex); Host busy, wedge stops transmission and waits for Xon from host.

**ACK/NAK** – Software flow control.
Decoder waits for an acknowledgement from the host.
- ACK (06 hex); message correctly received by host.
- NAK (15 hex); message incorrectly received by host.

Double RS-232 PC Term Mode – Activate

Some applications use several RS-232 terminals connected to a PC host system configured in PC Term mode. When a character is typed on a keyboard of a terminal, its scan code value is transmitted to the PC instead of its ASCII value. Then, upon reception, the PC sends back the corresponding ASCII character to display on the screen.

Therefore, once this mode is activated, the decoder sends the scan code value of each character read. BB+ and BBX supports this mode using the cable 6015-0490. The BI+ also supports it while connected in Double RS-232 mode.
Double RS-232 PC-Term Mode – Activate continued

To activate the PC-Term mode, read this bar code. It is advisable to insert a timeout of 50 ms between each character when baud rate is over 9600 baud.

ALL

PC-TERM RS-232 MODE – ACTIVATE

Upper/lower case characters and the type of numeric characters can be adjusted using the Upper/Lower Case Options bar codes contained in the Universal KBW Interface Configuration section of this manual.

Keyboard layout style can be selected without scanning "keyboard wedge mode activated" by using the Terminal/Keyboard Settings Number Pad bar codes also contained in the Universal KBW Interface Configuration section of this manual.

  - **LOW (0V)**
Symbology selection (bar code type) determines which symbologies the scanner will decode. Once you have determined the symbologies you wish to enable, turn to the following pages, enable those symbologies and set the data format options (e.g. check digit, start/stop characters, etc.) required by your host system for each symbology type. You must enable the symbology format options settings that are compatible with your host system.

NOTE

If your scanner does not support symbology selection, only the factory default symbologies pre-set with standard industry requirements will be available. Contact your dealer if you are unsure about your scanner's default settings.

Be sure to test the scanner using factory settings before making any changes.

Code 39 Options -- continued

The multi-read function permits the temporary storage of one or more codes in the decoder's memory which will then be transmitted in a single string message.

To operate the multi-read function, the desired group of codes to be first stored must have a mulit-read character as the leading character. This character can be chosen in the multi-read table in Appendix E after scanning the MULTI-READ ENABLED bar code (default is SPACE character). The transmission will start once a code having no multiread character is read.

MAXIMUM SELECTIVITY
(Three bar code captures, three decodes)
Symbology Leading Identifiers

Symbology-specific label identifiers comprise one or two ASCII characters that can precede or follow bar code label data as it is transmitted to the host. The host uses these characters to distinguish between symbologies.

Industry standards have been established for symbology-specific label identifiers, and are listed in the table below. Most scanners will have factory default identifiers preset to these standards.

Programming of label identifiers for some products will require use of additional manuals. Refer to page 13.

<th>SP400 WW</th>
<th>SP400 RF</th>
</tr>
</thead>
</table>

NOT ACTIVATED

ACTIVATED
SELECT THE "ON" CHARACTER

Scan the character from the Code 39 Full ASCII TABLE located in Appendix C, then scan the VALIDATION bar code.
SELECT THE "OFF" CHARACTER
Scan the character from the Code 39 Full ASCII TABLE located in Appendix C.
Transmission of the Full ASCII Character Set

Read the START label on the inside back cover.

The scanner will return to normal Operational Mode when all 96 characters are transmitted.
Lock Access to Programming

The LOCK ACCESS feature allows an administrator to control access to scanner programming.

To lock access to programming, follow this procedure:

1. Scan the START bar code on the inside back cover.

2. Scan this PROGRAMMING LOCKED bar code.

3. Scan the END bar code on the inside back cover.
Lock Access to Programming - continued

To unlock access to programming, follow this procedure:

1. Scan this UNLOCK ACCESS bar code.
   
   ![UNLOCK ACCESS]

2. Scan the START bar code on the inside back cover.

3. Scan this PROGRAMMING RE-AUTHORIZED bar code.
   
   ![PROGRAMMING RE-AUTHORIZED]

4. Scan the END bar code on the inside back cover.
Displaying the Firmware Level
Once the scanner is connected to a host system with communication parameters correctly adjusted, the level of the firmware implemented in the scanner can be displayed as follows:

1. Read the START bar code on the inside back cover.

2. Scan this DISPLAY FIRMWARE LEVEL bar code.

Once the DISPLAY FIRMWARE LEVEL bar code is read, the firmware level is transmitted and the decoder returns to its previous operational mode.
Displaying the Firmware Level - continued

The message will appear as follows:

FIRMWARE LEVEL: XXX.XX

If the SMARTY adapter is attached to the decoder, the message will include both the decoder and the smarty firmware levels as follows:

FIRMWARE LEVEL: XXX.XX + SXX.XX
Appendix B
Numeric Pad

The bar codes in this section provide a handy way to program numeric information into the scanner.

NOTE
Certain scanner models have been programmed by factory default to decode Code 39 bar codes with a minimum length of two digits, and will require reprogramming to allow the scanner to read single-digit bar codes. See the following page for instructions to change Code 39 minimum length.
Set Code 39 Minimum Length

To allow the indicated scanner models to read single-digit bar codes...

- Scan the SET C39 MINIMUM LENGTH bar code on the next page.
- Scan the C39 MINIMUM LENGTH = ONE bar code.
- Scan the END C39 MINIMUM LENGTH bar code on the second page following this page.

Reset Code 39 Minimum Length

After you’ve completed programming all scanner features that required you to read single-digit bar codes, you may want to reset the scanner with a two-digit minimum length for Code 39 bar codes.

- Scan the SET C39 MINIMUM LENGTH bar code on the next page.
- Scan the C39 MINIMUM LENGTH = TWO bar code on the second page following this page.
- Scan the END C39 MINIMUM LENGTH bar code on the second page following this page.
Set Code 39 Minimum Length

Appendix F

Enabling Code 39

Your scanner must be enabled to read the Code 39 (C39) symbology in order to read the programming bar codes in this manual.

To enable C39, follow these steps:

1. On the following pages, find the Enable Code 39 feature for your scanner model.
2. Scan the SET/END (CODE 39 ONLY) bar code for your scanner model from that page.
3. Scan the ENABLE CODE 39 bar code for your scanner model.
4. Scan the SET/END (CODE 39 ONLY) bar code for your scanner model.
5. Your scanner should now be able to read Code 39 bar codes.
Enable Code 39
Models: VS800, VS1200, HS1250 and Duet

<table>
<thead>
<tr>
<th>VS 800</th>
<th>VS 1000</th>
<th>VS 1200</th>
<th>HS 1250</th>
<th>QS 1000</th>
<th>QS 6000</th>
<th>Power Scan</th>
<th>Duet</th>
<th>SP400 WW</th>
<th>SP400 RF</th>
</tr>
</thead>
</table>

SET/END (CODE 39 ONLY)
VS800, VS1200, HS1250 and DUET models

<table>
<thead>
<tr>
<th>VS 800</th>
<th>VS 1000</th>
<th>VS 1200</th>
<th>HS 1250</th>
<th>QS 1000</th>
<th>QS 6000</th>
